

Cane Core Sampler Model 701

For extracting a representative sample of cane from transport.

The Core Sampler consists of a rotating 6" core tube fitted with a replaceable hard surfaced saw, mounted on a carriage car assembly. The unit is driven by an electro-hydraulic power pack. The complete assembly is mounted on a platform 18.4 ft. above ground level supported by a steel frame structure and concrete foundation.

One person operates the Core Sampler and Cane Breaker (shredder). The core tube is activated by the touch of a button and enters the load of cane (from above) at a 45° incline and extracts 12 pounds of cane material, which is a representative sample of the entire load. The core tube automatically swings and deposits the sample into the cane breaker by a hydraulic ejector cylinder inside the core tube.
